UNITED STATES: AN UNEASY FEELING (PART 2)

Recent data send conflicting signals about the outlook for the US economy. A survey of chief financial officers shows they have become gloomier and the nowcast of the Federal Reserve Bank of Atlanta is forecasting a contraction of real GDP in the second quarter. This would mean two successive quarters of negative GDP growth, which corresponds to the popular definition of a recession. However, the labour market continues to be strong and the majority of indicators used by the NBER Business Cycle Dating Committee are still in an uptrend. This suggests there is no imminent risk of recession yet.

In a recent survey, the chief financial officers of US companies have expressed their concern about the outlook for the US economy. 20.8% of respondents expect GDP to contract over the next four quarters¹.

Financial markets participants also feel nervous and show a mindset of 'good news may actually be bad news'. The latest labour market report was surprisingly strong, triggering a jump in bond yields, a strengthening of the dollar and a decline in equity market futures (chart 1). These reactions reflect an expectation that the Federal Reserve may have to tighten more than previously expected. In such a scenario, the reaction of equities reflects the impact of higher risk-free rates, but also unease about the implications of more aggressive rate hikes in terms of recession risk and the earnings growth outlook.

Perhaps the current strength of the US economy is being overestimated. The Atlanta Fed nowcast for second quarter GDP shows an annualized negative growth rate versus the previous quarter of -1.2%. During the quarter, the decline in the manufacturing ISM index has played an important role in explaining the drop in the nowcast (chart 2)².

In assessing the signal quality of a nowcast, it is important to look at the forecast errors³. Chart 3 shows that until the GDP number for the fourth quarter of 2019, the forecast errors had fluctuated in a rather narrow range. Unsurprisingly, this changed with the Covid-19 pandemic, which led to important swings in activity and to large forecast errors. Given the latest nowcast, it would require a very large forecast error for growth to be positive. Considering that first quarter growth was negative (-1.6%), a similar result for the second quarter would imply that the condition from the 'popular' definition of a recession - two successive quarters of negative quarterly real GDP growth - would have been met.

However, the National Bureau of Economic Research (NBER) business cycle dating committee, which determines the peaks and troughs in economic activity, considers a range of variables that are available monthly, rather than exclusively looking at GDP, for which data are published on a quarterly basis. Moreover, it also pays attention to the depth of the decline in economic activity.

For a detailed analysis, see: US: an uneasy feeling, Ecoweek, 4 July 2022, BNP Paribas.
 For an quantification of the impact of the various data releases on the GDP nowcast, see: https://www.atlantafed.org/-/media/documents/cqer/researchcq/gdpnow/RealGDPTrackingSlides.pdf

^{3.} The forecast error corresponds to the difference between the advance estimate of real GDP growth and the latest GDP nowcast available when the advance estimate was published. Forecasts are available starting with the nowcast for 2014 Q2. The standard deviation of the forecast error is 0.60% for the GDP data covering the period 2014 Q2-2019Q4. Extending the sample until 2022 Q1 gives a standard deviation of 1.33%.

To call a recession, the decline should be significant, so a relatively small decline in real GDP in two consecutive quarters would not warrant doing so⁴. To avoid revisions, the NBER committee prefers waiting long enough before determining the start or end of a recession. Consequently, by the time that a recession is officially called, the US economy will have been in this state for quite some time already. For this reason, it is recommended to follow the evolution of the six indicators that are closely monitored by the NBER committee (chart 4). Except for real manufacturing and trade industries sales, which have been declining for three months in a row, all indicators continue to be on a rising trend, which suggests there is no imminent risk of recession yet.

William De Vijlder

FORECAST ERROR OF GDP GROWTH NOWCAST

The US labour market continues to be strong and the majority of indicators used by the NBER Business Cycle Dating Committee are still in an uptrend. This suggests there is no imminent risk of recession yet.

^{4. &}quot;The NBER's traditional definition of a recession is that it is a significant decline in economic activity that is spread across the economy and that lasts more than a few months. The committee's view is that while each of the three criteria—depth, diffusion, and duration—needs to be met individually to some degree, extreme conditions revealed by one criterion may partially offset weaker indications from another." (source: NBER).

PMI: SLOWING GROWTH, EASING INFLATION TENSIONS

The downward trend of the global manufacturing PMI continued in June. The index dropped in the US and declined in the euro area to respectively 52.7 and 52.1, which brings us close to the crucial 50 mark. The various euro area countries for which data are available all recorded lower numbers. Data were also weaker in the UK and Japan. Australia, Mexico and, in particular, China saw an improvement.

The decline of new orders in the manufacturing sector continued as well and is more pronounced than for the overall index. Incoming orders weakened significantly in the US and the euro area in general as well as at the individual country level. The data are particularly poor in Germany and Italy. The order flow also declined in the UK and is very weak in the Czech Republic, Poland and Turkey. China benefited from a significant improvement. The situation in terms of new export orders is even worse than for orders in general. Against this background, the resilience of the employment data again came as a relief. The numbers weakened in June but in recent months the decline has been more limited than for the overall index or for new orders. The level of the employment PMI remains high. Poland is a major exception with a significant decline in June, bringing the index to 47.6. Despite the improvement of the overall index, the Chinese employment PMI hardly changed.

Delivery times continue to shorten but they remain particularly long. The pace of improvement is slow. The biggest improvement in June was noted in China. Another measure of price pressures -the manufacturing input prices index- recorded further easing in June at the global level and, quite significantly, in the US and the euro area. However, the net balance of companies being confronted with rising input prices remains high. Similar conclusions can be drawn with respect to manufacturing output prices: fewer companies are raising their prices but a vast majority continue to do so.

The services PMI continued its decline in the US, in the euro area and its member countries. The UK saw some improvement but the level remains well below that of April. The situation was also better in Japan, Brazil and especially China, for the same reasons as mentioned above (easing of mobility restrictions). The assessment of new business worsened in June, particularly in the US but the decline in the euro area and its members as well as in the UK was significant. Brazil and, even more so, China moved in the opposite direction with better data. The employment PMI in services registered another decline in June but the data are more resilient than for the overall services index. Germany and Italy are major exception, suffering from a drop in June. Hiring activity improved in Brazil, China and India. The tensions on input prices dropped in the US but ticked higher in the euro area. Output prices moved considerably lower in the US and eased in the euro area. The decline was significant in France.

UNITED STATES: A RUN OF BAD NEWS FROM CONFIDENCE SURVEYS

Results from the various economic activity indexes and confidence surveys are all pointing in the same direction. The US economic slowdown is becoming more severe, particularly judging by the sharp fall in the flash composite PMI for June, which came in at 51.2, down 2.4 points relative to May.

Consumer surveys are continuing to show a sharp drop in confidence. The University of Michigan Consumer Sentiment Index slumped 9.5 points in June, taking the total decline since January to 17 points, while the Conference Board Consumer Confidence Index – which had previously been more resilient – finally gave way, falling 3.5 points. The difference in the rate of decline between the two indexes stems mainly from the questions asked in the respective surveys. The Conference Board asks consumers about the current economic situation particularly jobs and the labour market, so the strong jobs market is shoring up this index. However, the University of Michigan focuses more on consumer perceptions of their own personal circumstances, so the inflation-driven fall in consumer real incomes is having a major negative impact on its index.

Surveys of manufacturing companies by the Federal Reserve Banks (FRB) are showing a significant decline in output, although with variations between districts. Businesses are reporting a fall in new orders, especially in the districts of Philadelphia and Dallas. This decline is partly at-tributable to higher input costs, which businesses are passing on to customers in the form of selling prices, which are now both exceptionally high. However, a downturn in both input prices and selling prices is now visible, and this should push down inflation in the next few months. Given current uncertainties and the deteriorating outlook in terms of demand, businesses are substantially cutting back their investment plans.

The only positive note is that the labour market has so far remained robust: the various FRB surveys show that businesses are firmly intending to hire new staff, while also suggesting that they will have to offer higher wages to do so. The labour market also remains stretched from the consumer perspective. Consumers are not having much trouble finding jobs: the relevant balance of opinion in the Conference Board survey fell again in June after a slight increase in May and is at a historically low level. Latest figures from the Bureau of Labor Statistics (BLS) confirm that the jobs market is robust, with 372 000 net salaried non-farm jobs created in June, slightly better than anticipated.

Félix Berte

The indicators in the radar are all transformed into 'z-scores' (deviations from the long-term average, as standard deviations). These z-scores have mean zero and their values are between -4 and +6. In the radar chart, the blue area shows the actual conditions of economic activity. It is compared with the situation four months earlier (dotted-line). An expansion of the blue area compared to the dotted area signals an increase in the variable.

ECONOMIC PULSE

11

GERMANY : THE END OF THE NEO-MERCANTILIST MODEL?

In May 2022, Germany recorded its first trade deficit since 1991. Due to a much bigger than expected increase in imports (2.7% m/m) and an unexpected drop in exports (-0.5% m/m), the country's trade balance was negative to the tune of EUR 1 billion. By comparison, Germany was running a monthly trade surplus of nearly EUR 20 billion at the end of 2019. Moreover, this deterioration of the trade balance is likely to continue. The Kiel Institute's real-time forecasts suggest that exports will continue to fall, and imports to grow, over the next two months. As a result, the trade deficit is expected to exceed EUR 4 billion by end-July.

To date, it has been rising import prices, and supply constraints more generally, that have caused the German neo-mercantilist model to wobble. However, a lack of demand could come into play in the second half of 2022. S&P Global's June survey of purchasing managers in industry reported significant worsening of their order books over a number of months. The balance on the new orders index has fallen by more than 15 points since January 2022, and by more than 22 points over the past year. The same picture emerges in the expected demand figures from IFO's survey, which shows a very marked fall of 29 points over the year to June. Although for the time being order books are full enough to cover several months of production, the weakening of demand could become the main drag on industrial activity as supply constraints start to ease.

When it comes to inflation, the slight dip seen in June (to 7.6% y/y from 7.9% y/y in may) was due largely to the exceptional steps taken by the government to cut public transport prices; a monthly pass giving access to all rail services apart from main-line trains was introduced at a cost of EUR 9 on 1 June. However, alongside the ensuing reduction in services inflation (2.1% y/y, from 2.9% in May), inflation in the prices of goods continued to accelerate (14% y/y from 13.6% in May). Nothing so far suggests that inflation in Germany has reached its peak.

Price increases will hit consumer spending, particularly on goods, and there are no signs of improvement. Retail sales rallied slightly in May (0.6% m/m) after their collapse in April (-5.4% m/m). Total consumer spending should, however, benefit from a return to normal in spending on services, where the scope to catch up remains substantial (services revenue in April was still 25% below its end-2019 level). Yet, it remains to be seen to what extent this will boost overall spending. Households might decide to switch from goods to services, rather than increase their overall spending.

Anthony Morlet-Lavidalie

The indicators in the radar are all transformed into 'z-scores' (deviations from the long-term average, as standard deviations). These z-scores have mean zero and their values are between -6 and +6. In the radar chart, the blue area shows the actual conditions of economic activity. It is compared with the situation four months earlier (dotted-line). An expansion of the blue area compared to the dotted area signals an increase in the variable.

ITALY: TOWARDS ANOTHER DIP?

Although real GDP held up in Q1 (+0.1% q/q), our barometer clearly shows that the economic outlook is worsening. Annual inflation rose again in June, going from 7.3% to 8.5%, while manufacturing output stagnated: although Italy's manufacturing PMI remained in the expansion zone at 50.9 in June, it fell for the seventh straight month and has been down 11.9 points over that period. The new manufacturing orders fell deeper into the contraction zone at 43.9 in June. Manufacturing activity would also be highly exposed if Russia were to cut off gas supplies completely – a more plausible scenario today – since 40% of Italy's gas imports come from Russia. However, improving conditions in the global logistics system are now showing through in both survey results – with a substantial improvement in the Italian PMI delivery times indicator in June – and hard data¹. Together with lockdown easing in China, this should support manufacturing output in Italy. Construction is also showing signs of flagging, due in particular to shortages of materials and their increasing price: the construction PMI fell sharply between February (68.5) and June (50.4). The sector's value added had previously rebounded very sharply in 2021 (+21.2%) and again in Q1 2022 (+5.8% q/q).

Developments in the labour market are also very mixed and less positive than the decline in the unemployment rate might suggest. The jobless rate has fallen steadily since October 2021 – from 9.2% to 8.1% – with the rate among young people (aged 15-24) down sharply from 28.7% to 20.5% over the same period. However, the labour force remains around 2% smaller than pre-Covid levels, which has amplified the fall in the unemployment rate.

At the same time, the war in Ukraine and the surge in inflation are gradually weakening the unity within Italy's ruling coalition. After Luigi Di Maio left the Five Star party because of differences of opinion about how to deal with the conflict in Ukraine, divisions have also appeared between parties about the future of the "citizen's income" in place since March 2019. The political climate is likely to remain tense until the parliamentary election scheduled for June 2023, and this is a source of concern for the country.

Guillaume Derrien

1. See BNP Paribas Ecoweek, Pulse, International trade: a few signs that tensions are easing, 27 June 2022

The indicators in the radar are all transformed into 'z-scores' (deviations from the long-term average, as standard deviations). These z-scores have mean zero and their values are between -3 and +5. In the radar chart, the blue area shows the actual conditions of economic activity. It is compared with the situation four months earlier (dotted-line). An expansion of the blue area compared to the dotted area signals an increase in the variable.

ECONOMIC SCENARIO

UNITED STATES

Despite a surprising contraction in Q1 2022, the US economy remains dynamic and well supported by household consumption and business investment. The robustness of the labour market which is at full employment, bolsters wages and household consumption. However, inflation, at its highest for four decades, causes a decline in purchasing power. As inflation is higher and more persistent than anticipated, the Federal Reserve is raising sharply the fed funds rate and shrinking its balance sheet. The downward revision of the government's fiscal ambitions, especially its social welfare and environmental plans, may also contribute to moderate growth. Against this background, despite avoiding a recession, the U.S. economy is expected to slow down clearly.

CHINA

Economic activity contracted in April due to the lockdowns imposed in large industrial regions such as Shanghai. This has led us to revise down our real GDP projection for 2022. Economic growth has rebounded since May and the authorities are enhancing fiscal and monetary easing measures. However, short-term downside risks remain high: exports will suffer from the slowdown in global demand, the correction in the property sector should continue, and the recent deterioration in the labour market should weigh on private consumption. Consumer price inflation is accelerating only moderately.

EUROZONE

The surge in inflation that began in early 2021 has morphed into an inflationary shock. Inflation continues to be driven primarily by energy prices but it is also becoming more widespread and thus more persistent. The deterioration of business climate surveys remained limited up until May but consumer confidence has worsened more noticeably. We expect growth to remain positive but weak in the coming quarters. The risk of a recession in the short term is increasing but, should there be one, it would only be technical (limited in duration and extent). The labour market remains robust and the economy still benefits from the cyclical momentum that existed prior to the war in Ukraine, fiscal measures that seek to cushion the impact of inflation on purchasing power, excess savings which are still available and the need to invest. In our scenario (no recession), we expect eurozone growth to reach 2.5% on average over 2022 and 2.3% in 2023.

FRANCE

Real GDP growth entered into negative territory in the 1st quarter of 2022 (-0.2% q/q after +0.4% in the 4th quarter of 2021), as a result of a decrease in household consumption (-1.5% q/q). Higher inflation has pressured households' purchasing power and should also weigh on Q2 expectations. In parallel, corporate investment maintained its growth (+0.4% q/q), as corporates have to cope with output capacity constraints. Overall, in 2022, GDP growth should ease to 2.3% (6.8% in 2021), against a background of higher inflation (5.4% expected in 2022 after 1.6% in 2021).

RATES AND EXCHANGE RATES

In the US, the Federal Reserve will continue its tightening policy at a swift pace. The terminal rate of 3.5% (upper end of the target range) should be reached towards the end of this year. The Fed's hawkish stance is motivated by still very low policy rates against a background of particularly elevated inflation and a strong labour market. When the economy slows down and inflation will be on a downward path, the Federal Reserve should adapt its guidance in an effort to achieve a soft landing. To a very large degree, US Treasury yields already reflect the prospect of monetary policy tightening. This means that year-end levels shouldn't be that different from current levels. For next year we expect somewhat lower yields as growth slows and inflation declines.

The ECB has announced to end its asset purchases at the start of July and to raise its deposit rate later that month. We expect 50bp rate hikes at its September and October meetings, to be followed by five further 25bp hikes between December 2022 and September 2023. This should cause an increase in Bund yields and a widening of sovereign spreads in the euro area. The Bank of Japan is expected to maintain its current policy stance, at least until Governor Kuroda's term ends in the spring of 2023. Thereafter, we expect the negative interest rate policy to be scrapped and the 10-year rate target to be hiked.

We expect the dollar to weaken significantly versus the euro. The dollar's valuation is expensive, positioning in the market is very long and the long-term interest rate differential should narrow. The yen has already weakened significantly versus the dollar, reflecting the prospect of increased policy divergence between the Fed and the Bank of Japan. We expect the exchange rate to remain around current levels for the remainder of the year. In 2023, the yen should appreciate considering that the federal funds rate should have reached its terminal rate and that the Bank of Japan is expected to tighten policy.

LATEST INDICATORS

In China, the services PMI jumped, beating expectations by a wide margin, on the back of the easing of mobility restrictions related to Covid-19 infections. In the US, growth of capital goods orders in May picked up slightly versus the previous month and was marginally ahead of the consensus forecast. Mortgage applications were down significantly and initial unemployment claims didn't change a lot. The ISM services index edged down but the result was better than anticipated. The labour market report was particularly strong with a large number of new jobs created in June, well above the consensus forecast. The EcoWatchers' survey in Japan recorded an unexpected decline, both in terms of the assessment of the current situation and the outlook. The Japanese services PMI on the other hand hardly changed. The PMI data in France were slightly below expectations. In Germany and the euro area, they were in line with the consensus. The services PMI in the UK moved higher, creating a positive surprise. In the euro area, retail sales increased in May after contracting in April but the improvement was smaller than anticipated.

CALENDAR: THE WEEK AHEAD

COMING INDICATORS

As usual around this time fo the month, a lot of data will be published in China: exports, imports, industrial production, house prices, retail sales, unemployment rate etc. In addition we will have the estimate of second quarter GDP growth. The ZEW survey results will be released for Germany and the euro area. In the US, a lot of attention will go to the publication of the beige book, the inflation data (both consumer and producer prices) as well as retail sales. Finally, at the end of the week, we will have University of Michigan sentiment.
