

ECOWEEK

No. 19-17, 26 April 2019

Growth, interest rates and government debt

- The relationships between government debt, economic growth and interest rates are complex and varied
- In general, a recession causes an increase in government debt and a decline in government borrowing costs
- A prolonged period of monetary accommodation during a cyclical upswing can cause the average nominal interest rate on government debt to drop below the rate of nominal GDP growth
- Depending on the level of the primary balance, such a situation can, under certain conditions, create leeway for fiscal expansion in order to support growth

The relationships between government debt, economic growth and interest rates are complex and varied. Recessions tend to cause a jump in government debt in absolute terms and as a percentage of GDP, but the ensuing monetary easing leads to a decline in government borrowing costs. Highly indebted countries however can suffer from investor distrust, which leads to a rise in the required risk premium and hence bond yields. A prolonged period of monetary accommodation during a cyclical upswing can cause the average nominal interest rate on government debt (r) to drop below the rate of nominal GDP growth (g). This is what has happened in recent years in a large number of countries. In a recent speech, former IMF chief economist Olivier Blanchard has elaborated on the policy leeway provided when $r < g$ ¹. In that case, a country can afford to run a permanent primary deficit (which corresponds to the general government deficit excluding interest charges) and yet have a stable debt/GDP ratio. When $r < g$ and the primary deficit is smaller than the critical level (i.e. the level at which the debt ratio is stable), it follows that the debt/GDP ratio will decline. In that case a country has leeway to conduct a fiscal expansion which would bring the primary balance to its critical level. Such a policy should boost growth in the short run. Faced with lacklustre private demand, this could make a considerable difference to growth: the fiscal multiplier could be big, although this also depends on the openness of the economy. It would also reduce the risk that low or negative growth has lasting adverse supply-side effects via a decline in capital formation. Fiscal expansion could also play a key role to complement monetary policy when it is constrained by very low interest rates.

Applying this thinking, a back of the envelope calculation² shows that in many countries, r is below g , which, taking into account the current primary balance, offers quite some leeway (chart). Of the bigger countries, Germany is in that position, whereas the UK and France only have limited leeway. Italy has none and, interestingly, the US primary deficit is already too high to stabilise the debt ratio. The argument can be made however that with $r < g$, the increase of the debt/GDP ratio would be very slow if the primary deficit would increase beyond its critical level. In addition, a low appetite for riskier assets (equities, corporate bonds, etc.) during a recession would mean that the borrowing requirement could be easily met without pushing yields higher. For countries which already have a high debt/GDP ratio, this argument may not hold and rising bond yields could limit the effectiveness of fiscal expansion³.

Source: BNP Paribas calculations based on IMF data

¹ Olivier Blanchard, Peterson Institute for International Economics and MIT, Public debt and low interest rates, American Economic Association Presidential Lecture, Jan. 2019.

² The calculations were based on data from tables A2, A7 and A23 of the statistical appendix of the IMF's Fiscal Monitor (April 2019). The difference between r and g corresponds to the IMF's projection of the interest rate–growth differential for the period 2019-24. In order to simplify the calculation, the primary balance which, given r and g , generates a stable debt/GDP ratio has been calculated based on the requirement of instantaneous stabilisation of the debt ratio.

³ This would be an illustration of the Lucas critique which states that economic relationships change when economic policy changes.

Pulse

United States: Strong growth, low inflation

The first quarter turned out to be strong after all. The just released (not yet shown on the chart) first estimate for first quarter GDP showed an annualised quarter over quarter increase of 3.2%, ahead of the consensus number of +2.3% and better than the previous quarter (+2.2%). Data released earlier this month had suggested that March looked good though not great. Retail sales, job creation and the ISM index for the manufacturing sector were better than expected. On the other hand, the Consumer Board consumer confidence index, the non-manufacturing ISM index and industrial production came in below the consensus. This also applies to the two measures of core inflation, which are also below the long-term average. The first quarter core PCE was only 1.3% so these data allow the FOMC to be patient before contemplating any move in its policy rate.

Indicators preview

A busy week ahead of us with meetings of the FOMC and the Bank of England, the manufacturing purchasing managers index in several countries, and, in the US, the two ISM indicators (manufacturing and non-manufacturing) as well as the Conference Board consumer confidence index. In France and Germany we have inflation data and in France first quarter GDP. Finally on Friday the very important US labour market numbers are published.

Economic scenario

UNITED STATES

- Growth is expected to slow to 2.3% this year. Trade war uncertainty acts as a drag, the housing market is softening, corporate investment should slow, as well as exports in reaction to the past strengthening of the dollar against a broad range of currencies.
- Core inflation remains well under control and has eased a bit.
- Following the dovish message from the January FOMC meeting, markets are pricing in a policy easing in the course of 2020.

CHINA

- Economic growth continues to slow, with an export outlook severely darkened by US tariff hikes.
- The central bank is easing liquidity and credit conditions, though the reduction in financial-instability risks via regulatory tightening should remain a priority. Fiscal policy has also turned expansionary through increased infrastructure spending and a rising number of household/corporate tax cuts.
- In the short term, private domestic demand should be affected by the knock-on effect of weakening exports and the continued moderation in the property market. Fiscal measures should support consumer spending.

EUROZONE

- The slowdown is becoming increasingly evident, especially in the German economy, which has suffered from one-off factors but also from a slowdown of exports to China. Capacity constraints also play a role. Business climate in the manufacturing sector continues to decline. Italy has now entered a technical recession with quarterly growth negative in the third and fourth quarter of 2018.
- Inflation is now expected to decrease following the past drop in the oil price, while core CPI is hardly moving. The activity slowdown also implies that the pick-up in core inflation should be slower than expected until recently. We do not expect the ECB to move rates this year (see below).

FRANCE

- Growth is slowing although the economy should show some resilience. Households' consumption should get a boost from the tax cuts and the jobs recovery but inflation reduces purchasing power gains. Business investment dynamics remain favourable. The global backdrop is less supportive. A slight rise in core inflation is appearing but remains to be confirmed.

INTEREST RATES AND FX RATES

- In the US, the Fed has announced to be patient before deciding on any change in its policy. We expect key rates to stay on hold. We have changed the forecast for 10 year treasury yields and now expect a yield of 2.80% by mid-year and 2.70% at the end of the year.
- As the ECB confirmed that key rates won't change this year, the forecast for 10 year Bund yields and now expect a yield of 0.30% by mid-year and 0.40% at the end of the year.
- No change expected in Japan.
- The prospect of a narrowing bond yield differential between the US and the eurozone should cause a strengthening of the euro, all the more so considering it is still below its long-term fair value (around 1.34).

Japan: This report is being distributed in Japan by BNP Paribas Securities (Japan) Limited or by a subsidiary or affiliate of BNP Paribas not registered as a financial instruments firm in Japan, to certain financial institutions defined by article 17-3, item 1 of the Financial Instruments and Exchange Law Enforcement Order. BNP Paribas Securities (Japan) Limited is a financial instruments firm registered according to the Financial Instruments and Exchange Law of Japan and a member of the Japan Securities Dealers Association and the Financial Futures Association of Japan. BNP Paribas Securities (Japan) Limited accepts responsibility for the content of a report prepared by another non-Japan affiliate only when distributed to Japanese based firms by BNP Paribas Securities (Japan) Limited. Some of the foreign securities stated on this report are not disclosed according to the Financial Instruments and Exchange Law of Japan.

Hong Kong: This report is being distributed in Hong Kong by BNP Paribas Hong Kong Branch, a branch of BNP Paribas whose head office is in Paris, France. BNP Paribas Hong Kong Branch is registered as a Licensed Bank under the Banking Ordinance and regulated by the Hong Kong Monetary Authority. BNP Paribas Hong Kong Branch is also a Registered Institution regulated by the Securities and Futures Commission for the conduct of Regulated Activity Types 1, 4 and 6 under the Securities and Futures Ordinance.
